

RISING SUN

The installation 'RISING SUN' consists of eleven floating circles (diameter max 150 cm) made out of toughened glass.

The range depends on the space which is available but the area measure must be comparable to 60 / 80 m².

The circles are each hanging on the steel construction of the hall.

The composition is depending on the specific character of a space.

The natural blast of air will bring the circles in constant motion.

JAN DOMS

The whole construction is variously reflected in the surface.

Visitors experience the installation like the reverse of the shining and rising sun.

Jan Doms - LEF (1949) designed and constructed the installation 'Rising Sun' as the scene for the music and glass performance 'Ballad of the rising sun', which was performed in a typical Westland Greenhouse (Zwinbrothers) as part of the Biennial of Kijkduin - The Hague 2011.
